Announcing the Final Examination of Golam Mohiuddin for the degree of Master of Science

Time & Location: October 20, 2014 at 12:00 PM in Engineering II 211
Title: Remote sensing with computational intelligence modelling for monitoring the ecosystem evolution in a constructed wetland of the Everglades

Monitoring the heterogeneous aquatic environment such as the Stormwater Treatment Areas (STAs) located at the northeast of the Everglades is extremely important in understanding the land processes of the constructed wetland in its capacity to remove nutrient. Direct monitoring and measurements of ecosystem evolution and changing velocities at every single part of the STA are not always feasible. Integrated remote sensing, monitoring, and modelling technique can be a state-of-the-art tool to estimate the spatial and temporal distributions of flow velocity regimes and ecological function in such dynamic aquatic environments. In this presentation, comparison between four computational intelligence models including Extreme Learning Machine (ELM), Boltzmann Deep Learning Machine (BDLM), Genetic Programming (GP) and Artificial Neural Network (ANN) models were organized to holistically assess the flow velocity and direction as well as ecosystem states within a vegetative wetland area. First the local sensor network was established using Acoustic Doppler Velocimeter (ADV). Utilizing the local sensor data along with the help of external driving forces parameters, trained models of ELM, BDLM, GP and ANN were developed, calibrated, validated, and compared to select the best computational capacity of velocity prediction over time. Besides, seasonal images collected by French satellite Pleiades have been analyzed to address the seasonality effect of plant species evolution and biomass changes in the constructed wetland. The key finding of this research is to characterize the interactions between geophysical and geochemical processes in this wetland system based on ground-based monitoring sensors and satellite images to discover insight of hydraulic residence time, plant species variation, and water quality and improve the overall understanding of possible nutrient removal in this constructed wetland.

Major: Civil Engineering

Educational Career:
Bachelor’s of Civil Engineering, BS, 2009, Bangladesh University of Engineering and Technology

Committee in Charge:
Ni-Bin Chang, Chair, Civil, Environmental and Construction Engineering
Martin Wanielista, Civil, Environmental and Construction Engineering
Woo Hyoung Lee, Civil, Environmental and Construction Engineering

Approved for distribution by Ni-Bin Chang, Committee Chair, on September 27, 2014.

The public is welcome to attend.
